

When one begins to ponder what a human being sees,
An effort can and should be made to varying degrees.
Are we after shape or size,
And as such needn't realize
Perception in a deeper guise
Reveals much more, such as if a color match agrees.

Physics cannot tell us the whole story that we see.
However useful we may find our radiometry
It comes up short unless we place
V-lambda in the center space,
To make perception the main case
And allow human judgement to become the key.

Thus the lumen can become more useful than the watt.
Important details of a source are accurately caught.
Integrate the visual range,
From photons to perception change.
However folks view this exchange,
V-lambda is a curve that's earned full credit for the aid it's wrought.
